

# Introduction to IT project management

KRYSTIAN WOJTKIEWICZ, PHD

# Planning

„FAIL TO PLAN, PLAN TO FAIL” – ROY KEANE

# Today's plan...

## Developing the Project Plan

## Risk management

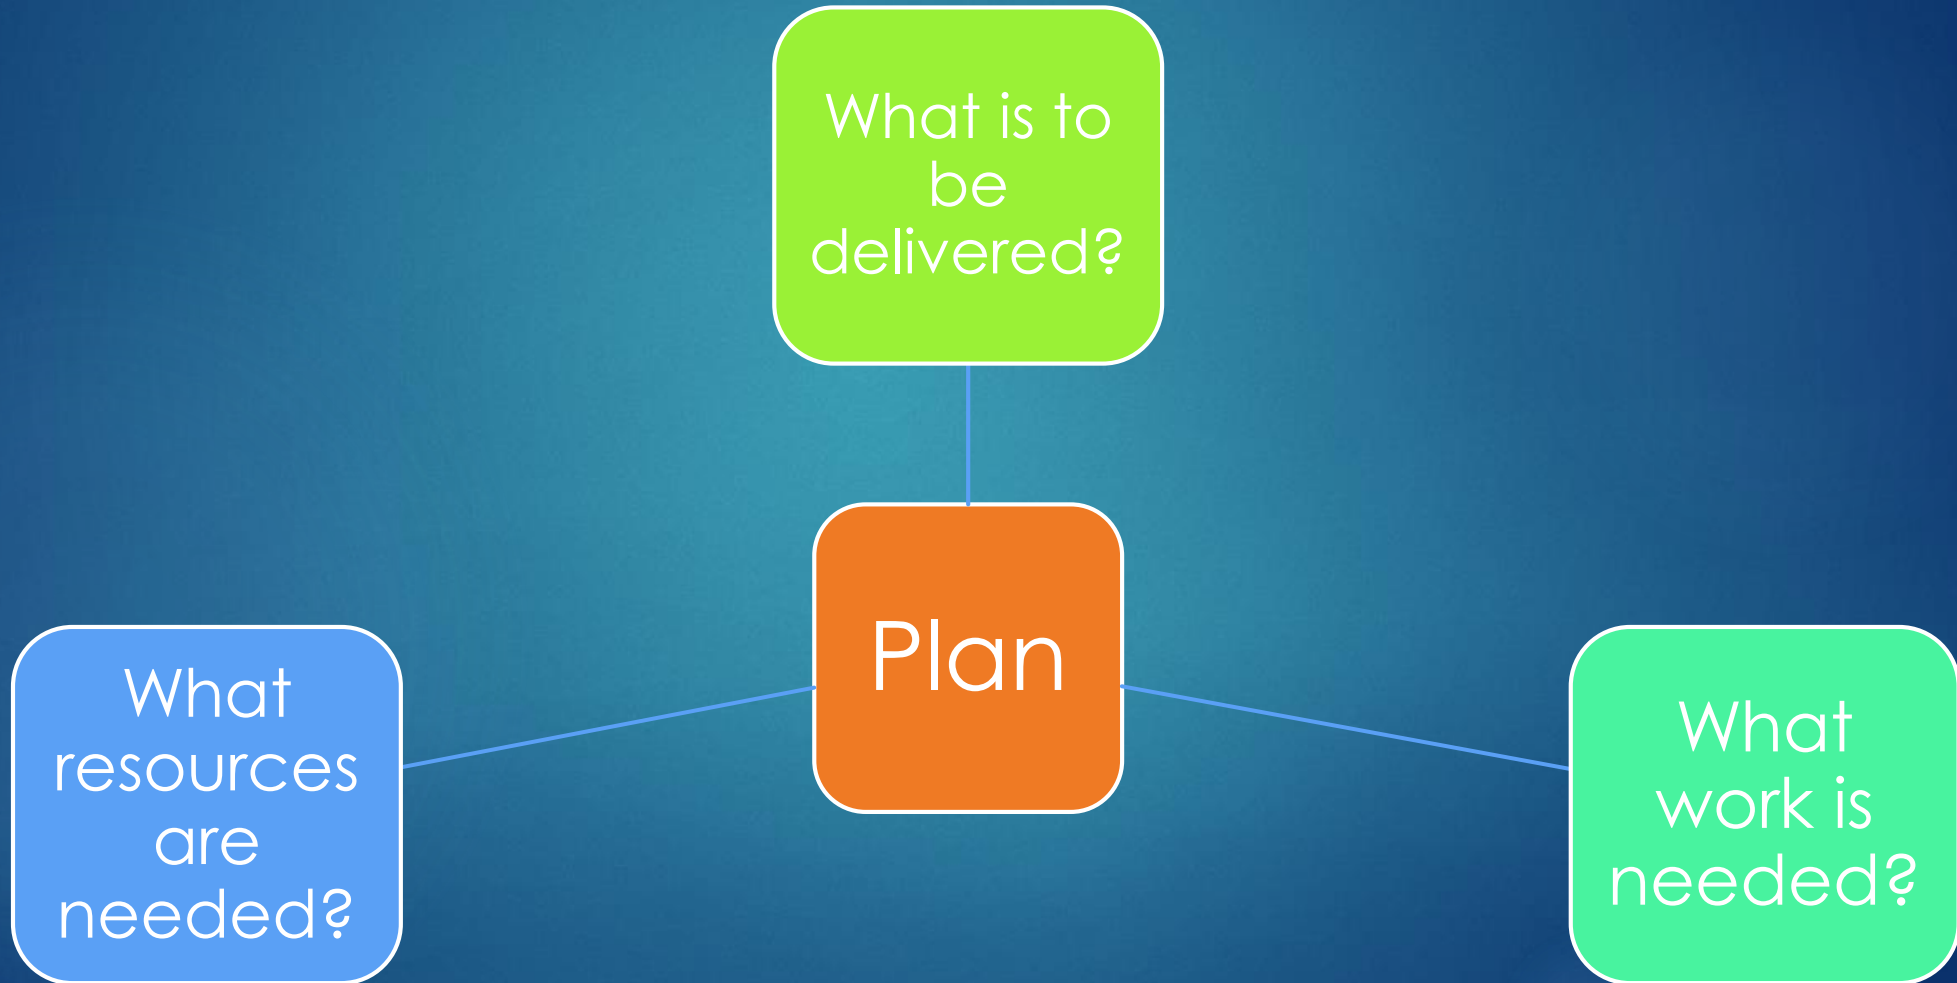

## Project Scheduling

1. Develop a work breakdown structure.
2. Identify task relationships.
3. Estimate work packages.
4. Calculate initial schedule.
5. Assign and level resources.

# Developing the Project Plan

# Work Breakdown Structures

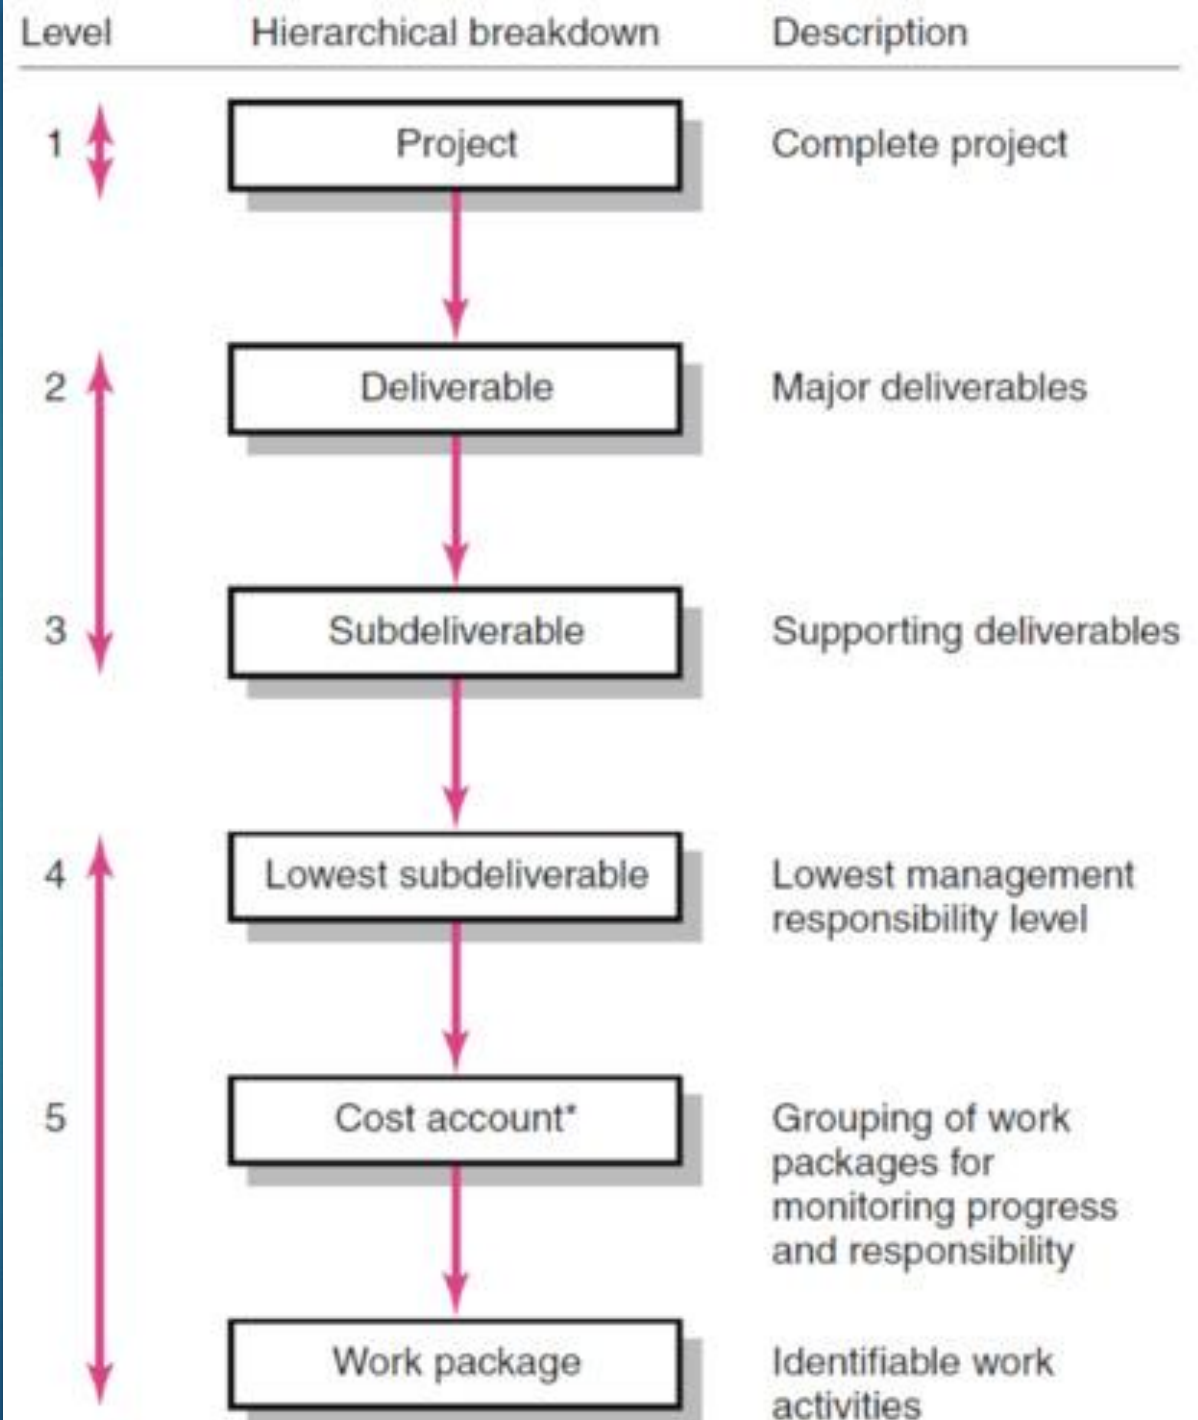

A diagram which breaks down the overall project into smaller chunks

This process is called „**decomposition**”

You decompose until you reach Work Packages

# Hierarchical breakdown of the WBS

A hierarchical method that subdivides the work of the project into smaller detail.  
-WBS is an outline of the project with different levels of detail.

# WBS

## Work Package

- Lowest level of WBS
- short-duration tasks that have a definite start & stop point, consume resources & represent cost
- Work package manager is responsible for seeing that the package is completed on time, within budget & to technical specifications.

# WBS

## Coding System

- used to define levels and elements in the WBS, organization elements, work packages & budget & cost information.
- The codes allow reports to be consolidated at any level in the structure. Common used is numeric indention.

## Work breakdown dictionary

- provides detailed information about each element in the WBS. The dictionary typically includes the work package level (code), name, and functional description

# WBS

Identification of the project independently of the contribution of each stakeholder

---

Defining the boundary of the "scope of work" (no "scope creep")

---

Breaking the scope of work into manageable work packages

---

Building the base for project planning and control, in terms of time, cost, quality etc.

---

Coherence between synthetic view (upper level) and analytic view (lower level) of the project

---

Identification of repetitive and non repetitive components of the project

---

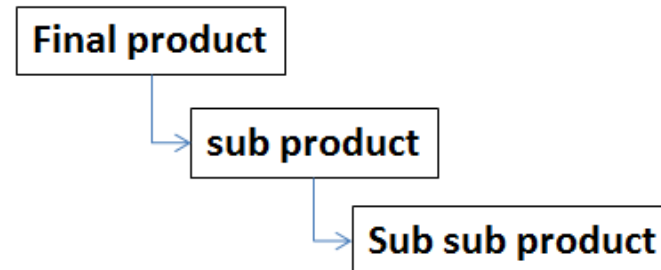

The WBS allows for pointing out project interfaces (operational, managerial, organizational) between different WP

---

# Product Breakdown Structure

PBS breaks down the scope of work based on **product** and **service** elements with an increasing detail level (systems, groups, parts).

## Product breakdown structure

## Work breakdown structure

# PBS - Product Breakdown Structure

## Functional approach

based on systems functionally completed and consequently independently testable (commissioning)

## Structural approach

groups of parts physically connected (construction)

## Market approach

we can identify for each product element a specialised supplier in a specific market sector. It is dominating in the procurement phase.

## Modular approach

there is the coincidence between functional approach and structural approach, since each single module corresponds to a specific function. It is the best possible situation, because if we are able to increase the modularisation, the management is easier.

# ABS - Activity Breakdown Structure

Breaking down the scope of work into process elements with an increasing detail level (phase, work package, activity,...).

# Work Package questions

**You need to answer them for each Work Package:**

**How long will it take to complete?**

**How much will completing cost?**

**What resources are required to complete this?**

# What planning really is?

- ▶ Project planning consists of two main stages:  
**Risk Management** and **Project Scheduling**
  - ▶ The goal of the risk management stage is to **identify project risks** and take **the necessary precautions**.
  - ▶ The goal of project scheduling is to make a **detailed schedule** of all the tasks that need to be performed, with **specific time frames** and **resource allocations**.

# Risk management

# Risk management framework

## Identify risks

Find all the factors that threaten project objectives.

## Analyse and prioritize

Assess each risk in terms of its possible damage and likelihood of occurrence.

## Develop a response

Create strategies for reducing the possible damage and/or probability the risk will occur.

## Establish reserves

Set aside additional funding for the project that will be used for known risks and unknown risks

## Continuous risk management

Implement strategies and monitor the effects of these changes on the project.

# Identify the risks

---

Risk

Name

---

Possible impact

---

Time frame

---

Probability

---

Type

---

# Analyze and prioritize the risks

Risk Assessment Matrix				
Impact of Risk (Consequence)	Major	Medium	High	Extreme
	Moderate	Medium	Medium	High
	Minor	Low	Medium	Medium
Seriousness of Risk = Probability x Impact		Unlikely (0-33%)	Moderately Likely (33%-66%)	Highly Likely (66%-100%)
		Probability of Risk (Likelihood)		

# Develop Response Plans

## Accept the risks

This implies that you understand the risk and decide to do nothing about it. This is a common strategy when the impact or the probability are low.

## Avoid the risk

You can try to avoid a risk by choosing not to do specific parts of the project or by selecting a lower-risk option for meeting the project goals.

## Contingency plans

When you cannot ignore, nor avoid the risk and have no impact on the probability, you can try to reduce the negative impact and have a fall-back plan in place when the risk becomes reality. Note that contingency plans require a continuous monitoring of the risks, such that you can activate the contingency plans on time. This implies that this strategy can only be efficient if there is a way to detect the risk on time.

## Transfer the risk

This strategy typically boils down to paying for insurance. Another approach is setting up a fixed-price contract that will get the work done on time for a fixed price. Note that this could however introduce new risks as more external parties get involved.

## Mitigate the risk

This strategy tries to reduce the risk and more particularly the probability that the risk occurs. This often implies taking extra actions.

# Establish Contingency and Reserve Funds

## Contingency Reserve

Deterministic

Methods

## Project Scheduling

1. Develop a work breakdown structure.
2. Identify task relationships.
3. Estimate work packages.
4. Calculate initial schedule.
5. Assign and level resources.

**CAN'T FAIL THE PROJECT**

**IF YOU NEVER SCHEDULE IT**

# Calculate an Initial Schedule

## Forward pass

determine the earliest starting point (ES) and finish time (EF)

## Backward pass

determine the latest start time (LS) and latest finish time (LF) of each task

## Float of each pass

The float of an activity is the difference between its ES and LS (or EF and LF) and represents to what extent the start of an activity can be postponed in relation to its ES

# Critical path

Fast Tracking =  
Performing more operations in parallel

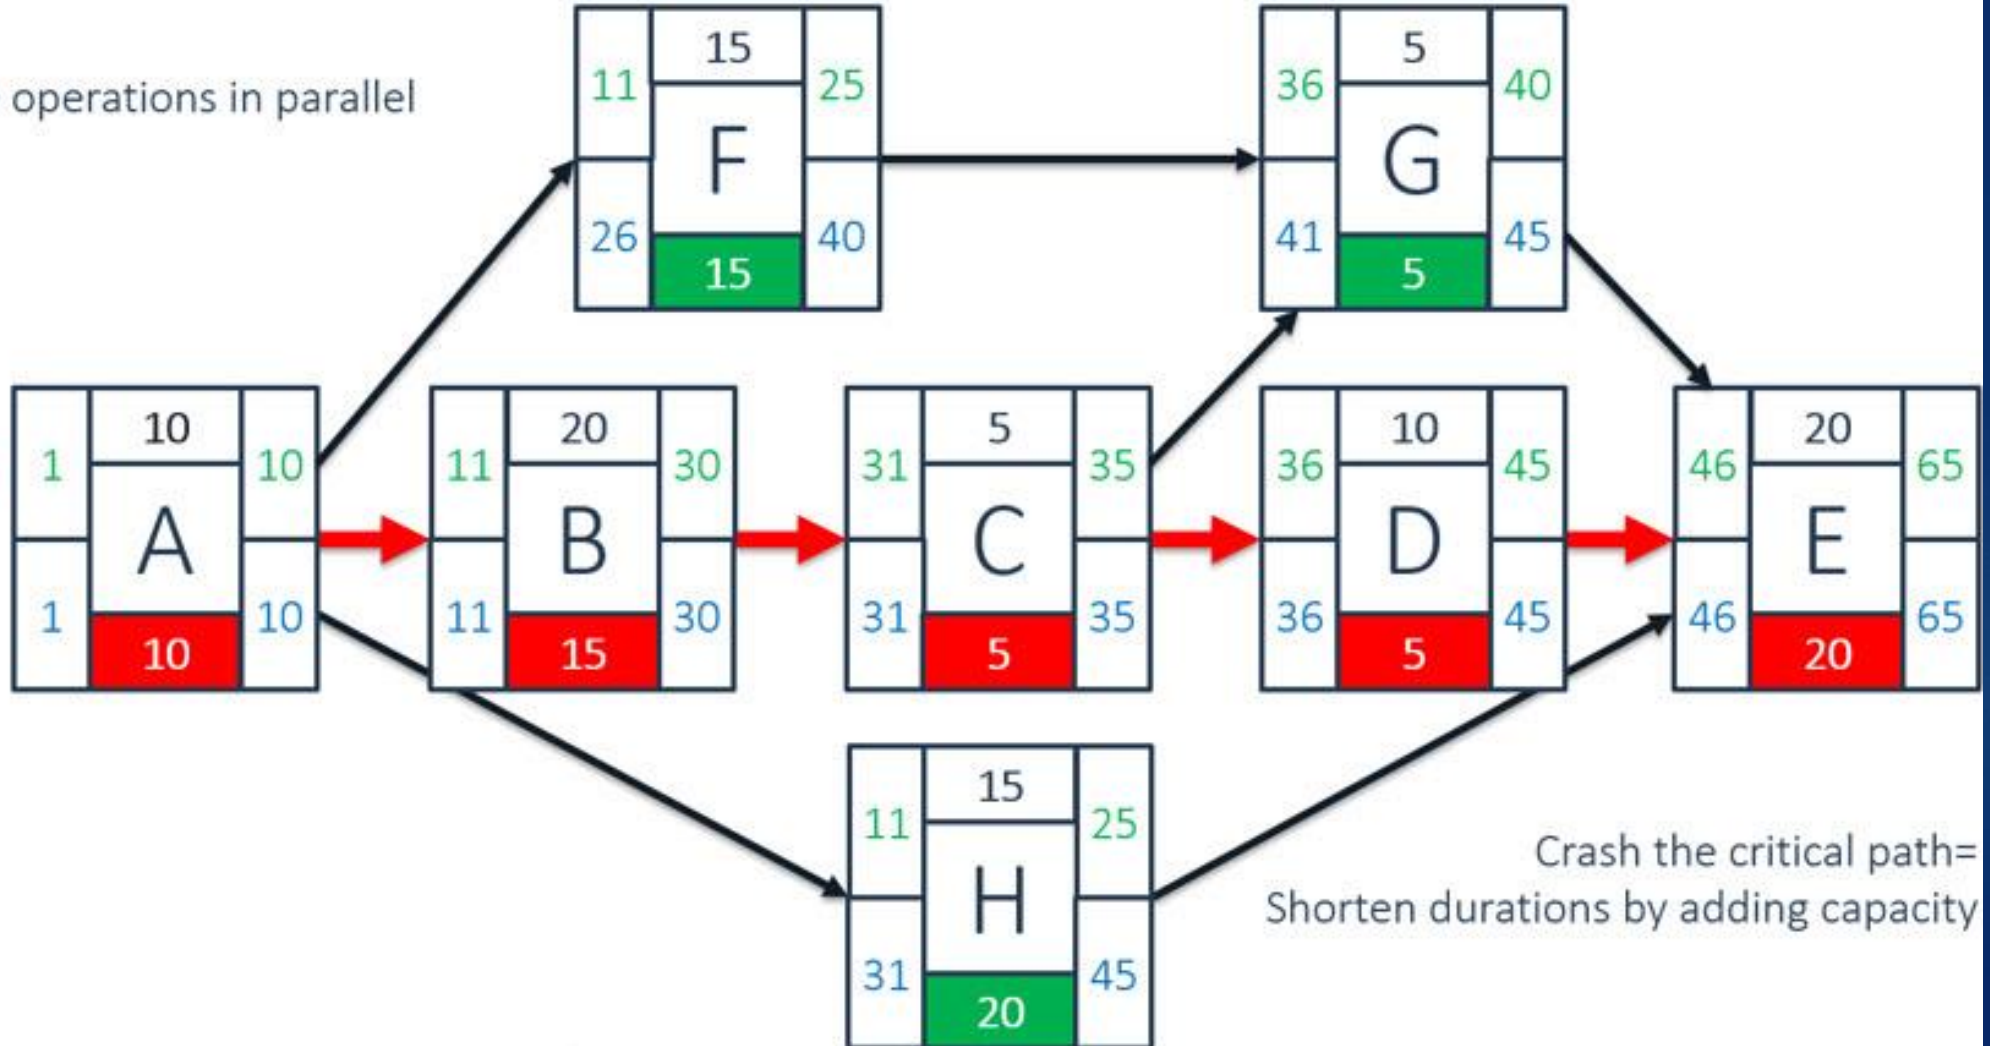

Total Float

Duration  
Early start/finish

Critical Path

Late start/finish

Drag

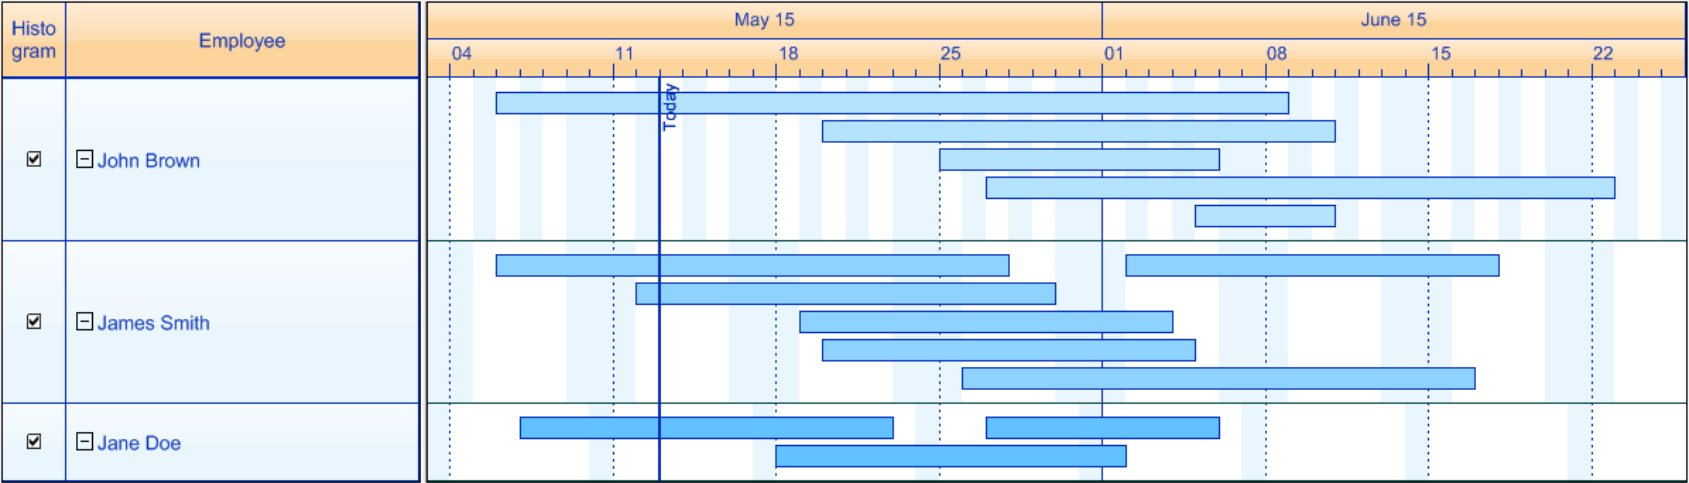

Total Float

# Assign and level resources

- ▶ Forecast the resource requirements throughout the project for the initial schedule.
- ▶ Identify the resource peaks.
- ▶ At each peak, delay non-critical tasks within their float.
- ▶ Eliminate the remaining peaks by re-evaluating the work package estimates.

# Assign and level resources

A meme featuring Dr. Doom from the movie 'Doctor Doom: Fearfall'. He is shown from the chest up, wearing his signature grey, high-collared suit. He has a bald head and a very intense, angry facial expression with furrowed brows and a wide, toothy grin. He is holding a large black bazooka over his shoulders. His hands are raised in front of him, with fingers spread in a 'V' or 'rock on' gesture. The background is a dark, industrial-looking interior with some metallic structures. At the bottom of the image, the text 'THAT'S ENOUGH NOW' is written in a large, bold, white, sans-serif font with a black outline.

**THAT'S ENOUGH NOW**
